

Antire

ANTIRE ACCELERATOR

Asset Insights Portal

A reusable operational data backbone for asset intelligence. Connecting SCADA, sensors, control systems, historians and OEM platforms into a governed foundation owned by the operator.

Antire

Most operators run on a patchwork of SCADA systems, OEM portals, historians and control systems, with critical signals locked behind vendor walls. Asset Insights Portal connects all of it, SCADA, sensors, control systems, historians and OEM platforms, into one governed foundation your organization owns. Connected once, served everywhere.

KEY CAPABILITIES

One model across vendors

Multi-vendor tag structures collapse into a single, standardized model, so the same signal looks the same across the whole fleet.

Trusted data for AI and analytics

Harmonized, quality-checked, traceable data that AI models and digital twins can actually rely on.

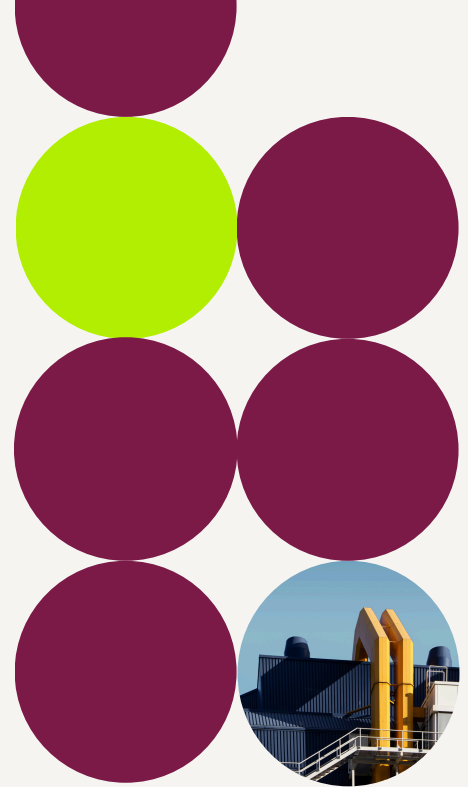

Less vendor lock-in

Runs in your own cloud environment, alongside your existing SCADA and historian estate (including OSIsoft PI)

Faster integrations

New APIs, dashboards or AI use cases connect to one governed layer instead of a new custom pipeline every time.

1x

Connect once, serve everywhere

One governed read path replaces a growing fan-out of point integrations.

100%

Customer-owned data layer

The operator owns the data, the platform and the deployed cloud.

4-8w

First Proof of Value

One site or one critical data flow, on real signals, before fleet rollout.

REFERENCE EXAMPLE

A Nordic offshore wind operator reduced its dependency on a monolithic OSIsoft PI setup and opened data access across the organization, with Asset Insights Portal running alongside the existing PI estate rather than replacing it.

TYPICAL USE CASES

Fleet-level data foundations · SCADA and historian access · AI-ready asset data · operational dashboards · PI modernization

Own your operational data.

Bring one data flow. We will prove it against your live SCADA and historian estate.
